"The only native 'chemical' industry is the making of glue from beeswax (iríti). This product is used extensively in arrow making. The crude beeswax collected from the hive is put in a pot, mixed with water, and brought to a boil. While it is cooking, the dirt and other impurities are removed. The wax is then cooled and coagulated into balls about the size of a baseball. When desired for use, the wax is heated and smeared over the parts to be glued. It is generally but not always the men who prepare and refine beeswax."
